This report values Juniper Green Energy using a bottom-up, 48-SPV financial model built from RHP project-level disclosures (see accompanying Excel model). Figures are presented in Rs million unless stated otherwise. Where the RHP does not disclose a figure, this report states "Not Disclosed" rather than estimating.

Juniper Green Energy Limited

Juniper Green Energy is one of India's top-10 renewable independent power producers (IPPs) by total capacity, operating a Build-Own-Operate model across solar, wind, wind-solar hybrid (WSH) and firm-and-dispatchable renewable energy (FDRE) assets. The company began as a management consultancy in 2011, pivoted into renewables in 2018, and has since scaled from 660 MW operational (FY24) to a 7,910 MW total portfolio (operational plus contracted plus awarded) as of June 2026 — a compounding trajectory built on winning increasingly complex, higher-tariff tenders rather than commodity solar auctions alone.

The equity story is a scale-and-de-risk narrative: 94.9% of total capacity sits behind 25-year, fixed-tariff PPAs with investment-grade central and state counterparties, in-house EPC execution retains construction margin and has produced a 147-day average early-commissioning track record, and the company is pivoting its incremental capacity mix toward higher-tariff, technically differentiated WSH/FDRE and battery storage (BESS) assets where competitive intensity is lower. Set against this is a capital structure under real strain: consolidated Net Debt/Equity was 2.79x at FY26 year-end and, on this report's base-case build-out, cash requirements to execute the disclosed pipeline push leverage meaningfully higher before it de-levers from FY29 onward.

Investment Highlights

- **Top-10 scale with a long-duration, contracted cash flow base.** 20 operational projects (1,794.80 MW) generate revenue under PPAs averaging 25-year tenors; 94.9% of total portfolio capacity is contracted or awarded against investment-grade off-takers.
- **Technology mix shifting toward higher-value, harder-to-replicate assets.** WSH and FDRE — projects requiring multi-technology integration and battery dispatch — make up 3,051.65 MW and 3,471.40 MW respectively of the 7,910 MW total portfolio, versus 955 MW of standalone solar.
- **Execution track record ahead of schedule.** Operational projects have historically commissioned an average of 147 days early, evidence of in-house EPC capability that most peers outsource.
- **Structurally low effective tax rate.** Key operating entities have elected the concessional corporate tax regime (25.168% under Sec. 115BAA; 17.16% under Sec. 115BAB for two subsidiaries) — a locked-in, non-holiday benefit, not a cliff-dated one.
- **Diversifying off-taker base.** Revenue concentration in the top two off-takers (GUVNL, MSEDCL) has fallen from 97.0% (FY24) to 86.1% (FY26) as the company adds SECI, NTPC, NHPC and SJVN-backed capacity.
- **BESS first-mover positioning.** Commissioned India's first merchant battery storage project (100.64 MWh, Rajasthan, Jan 2026); 4,563.88 MWh of BESS is in the broader pipeline.

Key Risks

- **Leverage trajectory.** Consolidated Debt/Equity of 3.77x and Interest Coverage of just 1.14x (FY26) leave thin headroom; this report's base-case model shows Net Debt/Equity peaking near 5.9x in FY28 before de-levering.
- **Execution concentration risk in the near-term pipeline.** A large share of Under-Construction-Awarded capacity (3,240 MW) has signed only a Letter of Award, not a PPA — commissioning-date assumptions for this bucket carry real uncertainty.
- **Off-taker concentration, though improving.** 86.1% of FY26 revenue still comes from two counterparties.
- **Fixed-tariff / rising-cost mismatch.** PPA tariffs are fixed for 25 years with no inflation escalator; input cost or rate inflation cannot be passed through outside narrow "Change in Law" provisions.
- **Merchant and import exposure.** 170 MW of capacity sells at uncontracted merchant prices; Rs45,463.83 million of FY26 equipment purchases originated from China, a geopolitical/trade-policy exposure.

Key Financial Snapshot

Pre-Issue Shares	488,989,292
Post-Issue Shares (at Rs225)	568,989,292
Implied Market Cap (at Rs225)	Rs128,023 million
Bid Period	July 30 – August 3, 2026
Listing (BSE & NSE)	On or about August 6, 2026
Lead Managers	ICICI Securities, HSBC, JM Financial, Kotak Investment Banking

KEY TAKEAWAYS

- Juniper is a scale, contracted-cash-flow story trading on forward growth — trailing multiples (32x EV/EBITDA, 316x P/E) look expensive only because FY26 hasn't caught up to the capacity base; forward multiples (7.7x, 19.4x) normalize sharply as the pipeline commissions.
- The central swing factor for the equity is execution risk on the Under-Construction-Awarded bucket and the leverage path required to fund it — not demand, tariff, or off-taker risk, which are comparatively well contracted.

From Consulting Shell to Top-10 Renewable IPP

History & Evolution

Juniper Green Energy was incorporated in 2011 as AT Capital Advisory India Private Limited, a management consultancy with no relationship to power generation. The pivot began in 2018 with the company's first competitive solar bid win in Maharashtra under the MSKVY scheme; the entity was renamed Juniper Green Energy in December 2018. It converted to a public limited company in May 2025 ahead of this listing. In under eight years, the company has moved from zero installed capacity to a 7,910 MW total portfolio — a faster capacity build than most listed domestic peers achieved over a comparable window, aided by a bidding strategy concentrated on technically complex tenders (WSH, FDRE) where competition is thinner than in standalone solar.

Business Segments

Segment	Description	Portfolio Share (Total MW)
Solar	Standalone utility-scale solar	955.00 MW (12.1%)
Wind	Standalone utility-scale wind	432.15 MW (5.5%)
Wind-Solar Hybrid (WSH)	Co-located solar + wind for a smoother generation profile; MNRE-mandated minimum 30% CUF	3,051.65 MW (38.6%)
Firm & Dispatchable RE (FDRE)	Solar + wind + battery storage delivering power to a committed dispatch schedule	3,471.40 MW (43.9%)
Battery Energy Storage (BESS)	Standalone + embedded storage; incl. India's first merchant BESS project	503.20 MWh operational; 4,563.88 MWh total pipeline
Power Trading	Merchant sales via subsidiary Juniper Green Power Trading; cross-border supply to Bhutan	Ancillary revenue stream

Business & Revenue Model

Juniper follows a **Build-Own-Operate** model: it wins auctions, self-funds and self-executes construction, and retains ownership of the asset for the life of the PPA (20-25 years), rather than building-and-selling or operating third-party assets. Revenue is earned almost entirely from electricity sales under fixed-tariff PPAs, supplemented by Renewable Energy Certificate (REC) and Voluntary Emission Reduction (VER/carbon credit) sales, and a small merchant/trading book.

Asset Ownership & Value Chain — In-house vs. Outsourced

Value Chain Step	Juniper's Approach	Typical Industry Approach
Site prospecting	In-house, using GIS + wind/solar datasets	Mixed
Land acquisition	In-house; land bank of 12,000+ acres (solar), 300+ wind locations	Mixed
Engineering, Procurement & Construction (EPC)	In-house — retains construction margin, controls timeline/quality	Often outsourced to third-party EPC contractors
Operations & Maintenance (O&M)	In-house, with SCADA monitoring + AI/ML predictive maintenance	Often outsourced
Financing	Project-level SPV financing, target 75:25 debt:equity	Similar across sector

Geographic Footprint

Projects are concentrated in Gujarat, Maharashtra, Rajasthan and Madhya Pradesh — states that together represent ~41% of India's solar potential and ~60% of its wind potential. This is a deliberate resource-driven siting strategy rather than geographic diversification for its own sake; the concentration mirrors India's renewable resource map, not a risk-management choice.

Portfolio by Off-taker / Regional Exposure

Off-taker exposure used as a state proxy: GUVNL=Gujarat, MSEDCCL=Maharashtra, central PSU off-takers (SECI/NTPC/NHPC/SJVN) skew Rajasthan/MP-heavy.

Organisation & Simplified SPV Structure

Juniper Green Energy Limited (the listing entity) sits above ~48 individual project-owning SPVs (e.g., Juniper Green Kite Private Limited, Juniper Green Stellar Private Limited), each typically holding one PPA/LOA and its associated project financing. This is standard IPP structuring — it ring-fences project-level debt and lender security to each asset, and allows Juniper to raise debt against contracted cash flows project-by-project rather than solely against the parent balance sheet.

Why the SPV structure matters for investors: project-level financing (target 75:25 debt:equity) means the consolidated balance sheet's leverage is a sum of many individually-collateralized project loans rather than one corporate facility — this is why per-project Debt Service Coverage Ratios matter more than a single consolidated coverage number, though the RHP does not disclose DSCR covenants for all 48 SPVs individually.

Competitive Positioning (headline)

Among listed and soon-to-be-listed renewable IPPs, Juniper is smaller in absolute scale than Adani Green, ReNew and NTPC Green, but posts a comparable or superior EBITDA margin (86.0% FY26 vs. peer range of ~86-90%) off a younger, faster-growing asset base skewed toward complex hybrid/FDRE tenders. See Section 8 for full peer comparison.

KEY TAKEAWAYS

- The in-house EPC/O&M model is the structural source of Juniper's high margins and early-commissioning track record — it is a genuine operating capability, not just a contracting choice.
- The SPV structure is standard for the sector and enables project-level financing, but it also means consolidated leverage metrics can obscure meaningful variance in individual project health.

From Auction to Cash Flow: The Project Lifecycle

The Eight-Stage Project Lifecycle

#	Stage	Description
1	Bidding & Auction	Evaluate tenders against internal return hurdles, off-taker credit quality, regulatory framework
2	Site Prospecting	GIS + resource-data driven site selection
3	Land & Grid Access	Secure land (lease/purchase/solar park allotment) and grid interconnection/evacuation infrastructure
4	Engineering & Technology	Select project configuration — e.g., high-efficiency TOPCon modules
5	Procurement	Advance orders with global vendors (Envision, Suzlon, First Solar, Waaree, Sungrow, TBEA) to de-risk supply chain
6	Project Financing	Target 75:25 to 80:20 debt:equity per SPV
7	Construction	In-house EPC; historical average 147 days ahead of schedule
8	Operations & Maintenance	SCADA + AI/ML predictive maintenance; revenue recognition begins at COD

Bidding Mechanics & Win Rate

Juniper bids into auctions run by central agencies (SECI, NTPC, NHPC, SJVN — generally AAA-rated, preferred for counterparty quality) and state agencies (GUVNL, MSEDCL), with a smaller book of privately-negotiated contracts (Tata Power). The company reports a 96.80% bid-to-win conversion rate on complex renewable tenders between April 2021 and March 2026, and ranks as the second-largest bidder by capacity won in WSH/FDRE tenders concluded in the same window — evidence of a genuine technical/execution edge in the harder-to-build categories, not just aggressive pricing.

From LOA to Revenue: The Contracting Sequence

Win auction → Letter of Award (LOA) issued (company can still adjust site/technology/interconnection until financial closure, typically 6 months pre-SCOD) → **Power Purchase Agreement (PPA) signed** (locks in 25-year fixed tariff; this is the point at which a project moves from "Awarded" to "Contracted" in this report's categorization) → **Financial closure → Construction** (13-24 months for standard WSH; 24-30 months for FDRE, per company disclosure) → **Commercial Operation Date (COD) → Revenue recognition begins** at the fixed PPA tariff, with Change-in-Law adjustments for specific statutory cost pass-throughs only.

Cash Flow Generation & Debt Repayment

Once operational, a project generates revenue with near-zero marginal fuel cost (sun and wind are free), an EBITDA margin structurally above 80% at the portfolio level, and predictable 25-year cash flows against a fixed tariff. Debt raised at the project level (75:25 to 80:20 target) is serviced from that project's own contracted cash flow — the standard project-finance structure for this asset class — with amortization profiles set against the PPA tenor. Equity returns are realized through the dividend/distribution capacity that remains after debt service, though Juniper has not yet established a dividend track record as a newly-public company (see Section 15, Risks).

KEY TAKEAWAYS

- Juniper's edge is concentrated in winning and executing complex WSH/FDRE tenders — a 96.8% win rate and #2 ranking in this category is a real, quantified competitive advantage, not a marketing claim.
- The LOA→PPA→COD sequence is the single most important operational chain to track for an investor — see Section 6 for how this report models timing risk in the Under-Construction-Awarded bucket specifically.

Off-taker Quality Is High; Concentration Is Improving But Still Material

Customer Mix & Counterparty Profile

97.68% of total capacity (as of June 30, 2026) is backed by counterparties rated "A" or above. The off-taker book splits into three tiers: central government nodal agencies (SECI, NTPC, NHPC, SJVN — typically AAA-rated and increasingly the majority of new contracted capacity), state DISCOMs (GUVNL, MSEDCL — historically the largest revenue contributors), and a small private/commercial book (Tata Power Company Limited).

Top-2 off-taker revenue concentration has fallen from 97.0% (FY24) to 86.1% (FY26) as new central-agency-backed capacity commissions.

Concentration Analysis

Off-taker	FY24 Revenue %	FY25 Revenue %	FY26 Revenue %
GUVNL (Gujarat)	51.32%	47.71%	39.85%
MSEDCL (Maharashtra)	45.68%	43.40%	46.21%
Top 2 combined	97.00%	91.11%	86.06%

Forward Diversification

The Under-Construction pipeline is explicitly more diversified: UCC and UCA capacity is contracted or awarded predominantly to SECI, NTPC, NHPC, SJVN and TPCL rather than GUVNL/MSEDCL, meaning the two-off-taker concentration ratio should continue falling as this capacity commissions — a structural improvement in counterparty risk that is already visible in the FY24-FY26 trend and should extend through the forecast period.

Receivable Quality

Trade receivable days have stayed in a tight 17-23 day band over FY24-26 (23.06 / 16.94 / 21.88), among the shortest in the listed Indian renewable sector per the company's own disclosed peer comparison — a direct benefit of high-quality, largely government counterparties and Late Payment Surcharge rules that have structurally shortened DISCOM payment cycles industry-wide (from 169 days in FY22 to 113 days in FY25).

Customer Risks

Concentration risk, though declining: the loss of, or a payment dispute with, either GUVNL or MSEDCL would still be a material single-counterparty event on FY26 numbers.

DISCOM financial health: Indian state DISCOMs have a history of delayed payments and financial stress; while Late Payment Surcharge rules have improved timeliness, the underlying credit risk of state-owned counterparties is systemic to the sector, not Juniper-specific.

Merchant book carries no counterparty credit protection: 170 MW of capacity sells at uncontracted market prices via IEX, with no long-term off-taker credit backing that revenue stream.

KEY TAKEAWAYS

- Off-taker concentration is a real but structurally improving risk — the pipeline mix, not just the operational book, should be the basis for forward-looking assessment.
- Receivable quality (17-23 days) is a genuine sector-leading operating metric and supports the working-capital assumptions used in this report's financial model.

India's Renewable Build-Out Is Entering Its Complex-Asset Phase

Indian Power Sector — Demand & Capacity Context

India's power demand growth and its 2030 renewable targets (500 GW non-fossil capacity under India's NDC commitments) are the macro backdrop for Juniper's entire order book. CRISIL projects total power-sector investment of Rs37-42 trillion between Fiscal 2027 and Fiscal 2031 — the addressable market Juniper is bidding into is expanding, not static, over this report's forecast window.

Segment Dynamics: Solar, Wind, Hybrid, FDRE, BESS

Segment	Industry Dynamic
Solar	Most mature, most competitively bid segment — tariffs have compressed as module costs fell and bidder count rose; lowest complexity, lowest differentiation.
Wind	Concentrated in resource-rich states (Tamil Nadu, Gujarat, Maharashtra, Rajasthan, Karnataka); higher CUF than solar but higher capex intensity per MW.
Wind-Solar Hybrid (WSH)	MNRE bidding guidelines mandate a minimum 30% annual CUF; industry commentary cites 40%+ achievable — a genuine technical differentiator versus standalone technologies.
FDRE	The most complex, highest-tariff category — combines solar, wind and battery storage to meet a committed dispatch schedule (50-80% availability in specified time blocks per CRISIL); fewer developers can execute this reliably.
BESS	Nascent but scaling fast — India's National Green Hydrogen Mission and grid-scale storage targets (14 GW/28 GWh by 2030 per Ministry of Power) are driving tender volume; over 50 GWh of standalone storage tendered as of March 2026.

Policy Support

- **Late Payment Surcharge (LPS) rules** have structurally improved DISCOM payment discipline sector-wide.
- **Advanced Chemistry Cell (ACC) battery manufacturing PLI** — Rs181 billion outlay targeting 50 GWh domestic capacity, expected to gradually reduce BESS import dependence.
- **National Green Hydrogen Mission** targets 5 million metric tonnes per annum by 2030, a stated future optionality area for Juniper, though not yet a revenue contributor.

Auction & Tariff Trends

CRISIL data cited in the RHP notes generation cost for new thermal capacity is rising with coal prices, while FDRE can be developed at a lower cost per MW-equivalent of firm capacity — a structural tailwind for FDRE bid competitiveness against thermal peaking capacity over the forecast period.

Juniper's own capacity-weighted contracted tariffs rise with technical complexity — FDRE tariffs run roughly 40-60% above standalone solar, reflecting the dispatch-commitment premium.

Competitive Landscape (Preview)

The industry has consolidated around a handful of well-capitalized developers — Adani Green, ReNew Power, ACME Solar, NTPC Green and Juniper among them — with scale, balance sheet strength and in-house execution capability now the key differentiators as auctions shift from plain-vanilla solar toward complex hybrid/FDRE/storage tenders. See Section 8 for a full comparison.

KEY TAKEAWAYS

- The industry's center of gravity is moving toward exactly the technically complex categories (WSH, FDRE, BESS) where Juniper has concentrated its bidding — this is a tailwind for the company's differentiated positioning, not a coincidence of timing.
- Rs37-42 trillion of projected sector investment through FY31 means the addressable opportunity for re-bidding is large — relevant context for why this report's "flat capacity beyond the disclosed pipeline" base case is a conscious floor, not a forecast of zero growth.

Bottom-Up, SPV-by-SPV: How 7,910 MW Becomes Revenue

This section is built directly from the project-level SPV database underlying this report's financial model — every disclosed Operational, Under-Construction-Contracted and Under-Construction-Awarded project is listed individually below; nothing is aggregated or estimated at the portfolio level. Where the RHP does not disclose a figure (e.g., exact SCOD for Under-Construction-Awarded projects), this report states the modeled estimate explicitly as an estimate, never as fact.

Operational Portfolio — 20 Projects, 1,794.80 MW

Entity	Technology	Off-taker	AC MW	PPA Tariff	PPA/COD Date
Nisagra Renewable Energy Pvt Ltd + Juniper Green Energy Ltd	Solar	MSEDCL	100.00	Rs3.15	Dec-2018
Juniper Green Sigma Pvt Ltd	Solar	GUVNL	120.00	Rs2.67	May-2019

Juniper Green Stellar Pvt Ltd	FDRE	SJVN	92.40	Rs4.38	Apr-2024	Nov-2026
Juniper Green Light Ten Pvt Ltd	FDRE	NHPC	350.40	Rs4.64	Dec-2024	Feb-2027
Juniper Green Beta Six Pvt Ltd	FDRE	NTPC	350.40	Rs4.69	Apr-2025	Apr-2027
Juniper Green Bess Zeta Pvt Ltd	FDRE	SJVN	351.20	Rs4.25	Mar-2025	May-2027
Juniper Green Cosmic Pvt Ltd	FDRE	NHPC	350.40	Rs4.37	Jun-2025	Jun-2027
Juniper Green Sigma Eight Pvt Ltd	FDRE	TPCL	140.00	Rs4.76	Sep-2025	Oct-2027

Impact on capacity, EBITDA, revenue and cash flow: this bucket alone adds 2,875.40 MW against fixed tariffs already locked in via

signed PPA — the highest-confidence source of forward growth in the model. Estimated remaining capex to complete: Rs89,954.69 million (RHP-disclosed capital commitments, ~36% of the Rs247,649.52 million total bucket cost; the balance was already spent/capitalized in FY24-26). EBITDA contribution follows the portfolio's ~86% margin structure once commissioned; cash flow benefit begins at each project's own SCOD, not before.

Under Construction — Awarded (11 Projects, 3,240.00 MW)

Execution risk note: these projects have received a Letter of Award but have not yet signed a PPA. SCODs shown below are this report's own estimate — LOA date plus the company's disclosed general implementation window (13-24 months for WSH, 24-30 months for FDRE) — not a company-disclosed date. Because most LOA dates are from 2024, this timing assumption compresses a large share of this bucket's commissioning into FY27, a finding this report flags as the single most important assumption to stress-test (see Section 15, Risks).

Entity	Technology	Off-taker	AC MW	Tariff (LOA-stage)	LOA Date	Est. SCOD (modeled, base case)
Juniper Green Beam Six Pvt Ltd	WSH	SECI	180.00	Rs3.25	Oct-2024	Oct-2026 (est., base case)
Juniper Green Light Four Pvt Ltd	WSH	SJVN	180.00	Rs3.43	Mar-2024	Mar-2026 (est., base case)
Juniper Green Alpha Three Pvt Ltd	WSH	SJVN	360.00	Rs3.19	Dec-2024	Dec-2026 (est., base case)
Juniper Green Energy Ltd	WSH	NTPC	360.00	Rs3.29	Apr-2024	Apr-2026 (est., base case)
Juniper Green Gem Pvt Ltd	WSH	NHPC	180.00	Rs3.48	Feb-2024	Feb-2026 (est., base case)
Juniper Green India Eight Pvt Ltd	WSH	SECI	180.00	Rs3.43	Jun-2024	Jun-2026 (est., base case)
Juniper Green Infinite Pvt Ltd	WSH	NTPC	180.00	Rs3.43	May-2024	May-2026 (est., base case)
Juniper Green India Alpha Pvt Ltd	WSH	NTPC	180.00	Rs3.43	Aug-2024	Aug-2026 (est., base case)
Juniper Green Sigma Six Pvt Ltd	WSH	SJVN	180.00	Rs3.41	Jun-2024	Jun-2026 (est., base case)
Juniper Green Beam Alpha Pvt Ltd	FDRE	NHPC	400.00	Rs4.56	Jan-2025	Jul-2027 (est., base case)
Juniper Green Power Omega Pvt Ltd	FDRE	NHPC	500.00	Rs4.48	Jan-2025	Jul-2027 (est., base case)
Juniper Green Bess One Pvt Ltd	FDRE	SJVN	360.00	Rs4.25	Feb-2025	Aug-2027 (est., base case)

Execution risk: Rs190,503.66 million of estimated project cost is almost entirely unspent as of the RHP date — this is the least de-risked part of the pipeline, and the one where PPA-signing delays, land-acquisition delays or tariff-adoption delays (each independently disclosed as a risk factor in the RHP) would most directly affect the model's near-term revenue and leverage trajectory.

Capacity Addition Timeline (Base Case)

Cumulative new capacity reaching COD by fiscal year, Base Case. The FY27 concentration reflects both UCC projects with FY27 SCODs and the compressed UCA timeline assumption above.

Capacity Waterfall

Capacity Waterfall to 7,910 MW Total Portfolio (as of Jun-2026)

7,910 MW total portfolio build-up across the three disclosure categories.

Technology Mix

FDRE and WSH combined represent 82.5% of the total portfolio — the technology mix is now dominated by complex, higher-tariff categories, not standalone solar.

Revenue Build-Up & Bridge

Revenue growth from FY26A to FY31E in this report's Base Case comes almost entirely from capacity commissioning (existing operational assets carry a fixed tariff with no organic growth), split roughly evenly between the UCC and UCA buckets on a base-case timing assumption:

Illustrative Revenue Bridge: FY26A to FY31E (Base Case)

Illustrative bridge — actual year-by-year phasing is SPV-specific and modeled at the project level in the accompanying Excel workbook (Revenue Model tab).

Revenue & EBITDA Trajectory

EBITDA margin expands from 86.0% (FY26A) toward 91-92% as the portfolio matures and fixed corporate overhead is spread over a larger revenue base.

EBITDA Build-Up Drivers

- **Volume:** capacity growth from 1,794.80 MW (Jun-26) toward the full 7,910.20 MW pipeline is the dominant EBITDA driver — near-

- zero marginal generation cost means almost all incremental revenue drops to EBITDA.
- **Mix:** shift toward FDRE/WSH raises blended tariff (see Tariff Analysis below), a second-order EBITDA tailwind.
 - **Cost discipline:** this report's model holds cost-per-MW roughly flat in real terms (5% p.a. inflation, MW-linked scaling) — no assumed operating-leverage efficiency gains beyond what capacity growth itself provides, a deliberately conservative treatment.

PLF / CUF Assumptions

Technology	CUF Used in Model	Basis
Solar	24.48%	FY26 actual, company-disclosed
Wind	31.84%	FY26 actual, company-disclosed
WSH/FDRE — currently operational capacity	24.48%	Physically solar-only at present — wind leg not yet commissioned per RHP footnotes; modeled at solar-equivalent CUF, not the eventual hybrid rate
WSH/FDRE — post-COD (new capacity)	30.0% (Base) / 25.0% (Bear) / 40.0% (Bull)	MNRE-mandated 30% bidding minimum used as the conservative base case; no Juniper-specific hybrid operating history exists yet to support a higher figure with confidence

Tariff Analysis

Item	Detail
Tariff structure	Fixed for the full 25-year PPA term; no inflation escalator
Change-in-Law adjustments	Rs0.06-0.28/kWh additional compensation on specific operational projects for statutory cost changes (e.g., GST, customs duty) — the only mechanism by which realized tariff can move
Phased-commissioning billing	Several WSH/FDRE projects bill at a discrete, lower solar-only tariff (e.g., Rs2.42, Rs2.28, Rs2.475/unit) until the wind leg also commissions — a real, disclosed mechanic this report's model reflects for the currently-operational WSH/FDRE bucket
Merchant tariff	Not fixed; sold on IEX or short-term bilateral contracts. Base case uses the disclosed FY26 realized average (~Rs2.83/kWh) for the 170 MW merchant bucket

KEY TAKEAWAYS

- The UCC bucket (2,875.40 MW, PPA-signed) is the highest-confidence growth driver; the UCA bucket (3,240.00 MW, LOA-only) carries the model's single largest source of timing uncertainty.
- CUF and tariff assumptions for new WSH/FDRE capacity are deliberately anchored to regulatory minimums and disclosed actuals rather than industry-aspirational figures — investors modeling a more optimistic hybrid CUF should treat this report's Base Case as a floor, not a central estimate of upside.

Typical Project-Level Economics

Capital Structure per SPV

Item	Typical Range / Figure
Target Debt : Equity	75:25 to 80:20 (company-disclosed, project-level)
Implied project-level Debt/Equity	~3.0x-4.0x — structurally higher than the consolidated 3.77x, since holding-company equity offsets some project leverage
New debt interest rate (disclosed term-loan band)	7.75% - 9.75% p.a.; NCDs 10.45%; Green loan 10.00%
Construction period	13-24 months (WSH); 24-30 months (FDRE), from LOA/bid award
Construction-to-moratorium	Up to 1 year interest moratorium on term loans — interest capitalized into project cost during construction, not expensed
PPA / asset useful life	25 years (solar); 20-25 years (wind/WSH/FDRE/BESS)
IRR / ROE (project-level)	Not Disclosed in the RHP at the individual-project level
Payback period	Not Disclosed in the RHP at the individual-project level

Cash Flow Profile Over a Project's Life

Years 1-2 (construction): capital outflow only, financed 75:25 debt:equity; interest capitalized, not expensed. → **COD:** asset transfers from CWIP to depreciable Property, Plant & Equipment; revenue and depreciation both begin. → **Years 3-15 (ramp/steady-state):** ~86% EBITDA margin against a fixed tariff; debt amortizes against contracted cash flow; net cash generation builds as principal is repaid. → **Years 15-25:** majority of debt repaid, cash conversion improves further; asset approaches useful-life end with a modest decommissioning provision accrued throughout.

Illustrative Unit Economics — Solar (per 100 MW), FY26 realized inputs

Metric	Value
Installed Capacity	100 MW
CUF (FY26 actual, solar)	24.48%
Annual Generation	~214.4 million kWh
Weighted Avg. Solar Tariff	Rs2.80/kWh
Implied Annual Revenue	~Rs600 million
Implied EBITDA (at ~86% margin)	~Rs516 million

Illustrative only — actual project economics vary by tariff, technology, and off-taker; see this report's Revenue Model tab for full SPV-level detail.

KEY TAKEAWAYS

- The RHP does not disclose project-level IRR, ROE or payback — this report states that gap explicitly rather than estimating figures the company itself has not published.
- The interest-moratorium-during-construction mechanic is why capitalized finance costs show up prominently in CWIP additions — a modeling detail investors reconciling the balance sheet should be aware of.

Smaller Scale, Comparable Margins, Faster Growth

Peer Comparison — FY26 Financials

Company	Revenue (Rs mn)	EBITDA (Rs mn)	EBITDA Margin	PAT (Rs mn)
Juniper Green Energy	7,189.34	6,921.84	96.3%*	404.64
ACME Solar Holdings	20,233.79	22,650.37	112.0%*	4,978.85
ReNew Power Global	134,305.00	88,492.00	65.9%	10,385.00
Adani Green Energy	129,280.00	116,590.00	90.2%	19,870.00
NTPC Green Energy	28,584.20	24,716.10	86.5%	5,213.10

*EBITDA/Revenue can exceed 100% where EBITDA is computed on Total Income (incl. Other Income) rather than Revenue from Operations alone, per each company's own disclosure convention — figures shown as reported/derived, not independently normalized across companies. Peer figures per RHP KPI comparison table (p.192-194); treat as approximate given differing disclosure conventions.

Margin comparison should be read alongside the note above — disclosure conventions differ across issuers.

Revenue Scale vs. Listed Renewable Peers (FY26, log scale)

Juniper is materially sub-scale versus Adani Green and ReNew on absolute revenue — the investment case rests on growth rate and asset quality, not current scale.

Qualitative Comparison

Dimension	Juniper Green	Sector Positioning
Technology mix	82.5% WSH+FDRE (total portfolio)	Ahead of most peers in complex-asset mix shift
Geography	Concentrated: Gujarat, Maharashtra, Rajasthan, MP	Less geographically diversified than Adani Green/ReNew
Execution	In-house EPC; 147-day average early commissioning	Differentiated — many peers outsource EPC
Balance sheet	Net Debt/Equity 2.79x (FY26), Interest Coverage 1.14x	Thinner headroom than larger-cap peers with deeper equity bases
Track record as public company	None — first-time issuer	Adani Green, ReNew, NTPC Green all have public trading history

KEY TAKEAWAYS

- Juniper competes on execution quality and technology-mix positioning, not on balance sheet scale — a smaller, more leveraged, faster-growing challenger relative to Adani Green and ReNew.
- As a first-time issuer, Juniper carries no public market track record on capital allocation, dividend policy or disclosure quality — an intangible but real risk discount versus peers with a trading history.

Founder-Led, Singapore-Anchored Promoter Group

Ownership

Promoters — Arvind Tiku, Hemant Tikoo, Niharika Tiku, Juniper Renewable Holdings Pte. Ltd. and AT Holdings Pte. Ltd. — hold 488,989,292 shares, 99.43% of pre-issue capital on a fully diluted basis. Juniper Renewable Holdings (the controlling corporate promoter) is itself owned 75.01% by AT Holdings Pte. Ltd. and 24.99% by Rosco S.A. One notable disclosure: Juniper Renewable has pledged 7,194,462 shares (1.46% of pre-issue capital) to IREDA as project-financing security — temporarily released for the IPO per SEBI requirements and due to be re-pledged within 60 days of listing.

Key Executives — Investment Relevance

Name	Role	Relevance to the Investment Case
Arvind Tiku	Chairperson & Non-Executive Director	Co-founder; also chairs Experion Developers (real estate) and AT Capital entities — a multi-sector operator, not a renewables-only specialist by background.
Ankush Malik	Whole-time Director & CEO (since Apr-2024)	Sits on the board of ~10 individual project SPVs directly — signals hands-on operational involvement at the asset level, not purely a holding-company role.
Parag Agrawal	Whole-time Director & CFO (since Jul-2026, i.e., newly appointed at IPO)	A CFO appointment concurrent with listing is worth noting — investors have no track record of this specific CFO's public-company financial stewardship yet.
Balaji Viswanathan Swaminathan	Independent Director	Broad listed-company board experience (Allied Blenders, Haldia Petrochemicals) — brings independent governance perspective from outside the promoter group.

Board Composition & Governance

- 8 Directors: 2 Whole-time, 2 Non-Executive (promoter-affiliated), 4 Non-Executive Independent (one woman director) — a board structure that meets, but does not exceed, standard Indian listed-company independence norms.
- The CEO and incoming CFO both hold directorships across numerous individual project SPVs — reasonable for a founder-led IPP at this stage, but worth monitoring for governance bandwidth as the SPV count grows further.

KEY TAKEAWAYS

- Ownership is tightly held (99.43% pre-issue) with a Singapore-domiciled holding structure — standard for internationally-backed Indian infrastructure issuers, but means free-float post-IPO will be thin (~11.7% of post-issue shares, calculated from the Rs18,000mn fresh issue against the pre-issue base).
- Both the CEO's five-year term (from Apr-2024) and the CFO's term (from Jul-2026) are recent — management continuity through a full PPA cycle is unproven, a normal but real characteristic of a first-time issuer.

Renewable Impact Is the Business Model; Formal ESG Disclosure Is Still Maturing

Environmental — Renewable Impact

By construction, Juniper's entire revenue base displaces fossil generation — every MWh sold is a clean-energy MWh. The company additionally monetizes this directly through Renewable Energy Certificates (RECs) and Voluntary Emission Reductions (VERs/carbon credits), including a 25-year agreement to sell International RECs (IRECs) to a pharmaceutical off-taker at Rs360/IREC from the Cosmic project. **Not Disclosed:** a company-specific quantified tonnes-of-CO₂-avoided metric was not identified in the RHP.

Governance

- 4 of 8 board seats are independent, including one woman independent director — meets standard governance norms for a newly-listed Indian company.
- CSR spend follows the statutory formula (2% of trailing 3-year average net profit) — Rs5.42mn (FY24), Rs9.94mn (FY25), Rs14.05mn (FY26); modest in absolute terms, tracking the company's still-small historical profit base rather than its much larger asset base.
- Related-party transactions exist across the SPV structure (disclosed as a formal risk factor) — standard for a group with 48+ subsidiaries, but a governance area for continued monitoring.

Social & Sustainability Positioning

India's Nationally Determined Contributions (NDCs) and 500 GW non-fossil capacity target by 2030 provide durable policy tailwinds for the entire sector, including Juniper's growth plans. The company's National Green Hydrogen Mission optionality (targeting India's 5 million metric tonnes/year 2030 goal) is a stated future direction, not yet a revenue line.

ESG Risks

Land acquisition in remote project locations can create right-of-way and local-community friction — a disclosed operational risk factor, and one with reputational as well as execution dimensions.

No formal BRSR (Business Responsibility and Sustainability Reporting) metrics were identified as disclosed in the RHP at the granularity institutional ESG screens typically require — this is common for first-time Indian issuers but will likely need to mature quickly post-listing given growing investor ESG-disclosure expectations.

KEY TAKEAWAYS

- The ESG case is structurally strong (the business IS decarbonization) but formal, quantified ESG reporting is underdeveloped relative to what a global institutional ESG mandate would typically require — a disclosure gap, not a business-model gap.

FY24-FY26: Scaling Fast, Margins Holding, Leverage Building

Revenue +41.3% (FY26), EBITDA margin stable at 85-87% across all three years — thePAT growth lags EBITDA growth materially — depreciation and finance costs from margin structure is not a one-off, it's the business model.

Net Debt/Equity nearly tripled FY25→FY26 (0.85x→2.79x); Interest Coverage fell belowCapex has outpaced CFO by 8x-18x every year FY24-26 — this is a growth-financed, not self-funded, capital cycle; equity and debt markets are doing the heavy lifting.

Cash Flow Summary

Rs million	FY24A	FY25A	FY26A
Net Cash from Operating Activities	3,222.25	3,650.68	4,699.92
Net Cash used in Investing Activities	(15,795.44)	(41,828.19)	(65,097.69)
Net Cash from Financing Activities	12,313.81	40,712.21	68,661.96
Cash & Equivalents, Year End	220.72	2,755.52	11,019.87

Working Capital & Return Ratios

ROE/ROCE compressed FY24-26 despite EBITDA growth — the expanding asset and debt base is outrunning near-term profit conversion; this should reverse as the pipeline matures into steady-state cash generation (see Section 6).

KEY TAKEAWAYS

- Every historical metric tells the same story: a high-margin, capital-intensive business in an aggressive build-out phase, where PAT and return ratios are temporarily depressed by depreciation and interest on capacity that hasn't yet ramped to full contribution.
- The FY26 leverage jump (Net Debt/Equity 0.85x→2.79x) is the single data point most relevant to how much further leverage can climb before covenant or rating pressure becomes binding — see Section 15.

Historical Ratio Trends (FY24A-FY26A)

Ratio	FY24A	FY25A	FY26A
Revenue Growth %	—	29.9%	41.3%
EBITDA Growth %	—	31.0%	42.5%
PAT Growth %	—	(9.0%)	10.9%
EBITDA Margin	87.4%	85.2%	86.0%
ROE	2.3%	1.4%	1.2%
ROCE	5.6%	4.8%	3.6%
Debt/Equity	1.54x	1.64x	3.77x
Net Debt/EBITDA	4.89x	5.87x	13.82x
Interest Coverage	1.30x	1.21x	1.14x
Days Receivable	58.6	51.9	56.8*
Days Payable	61.4	61.6	68.2

*This report's ratio computed on total trade receivables/revenue differs slightly from the company's own disclosed 21.88-day "billed revenue" KPI (which excludes unbilled revenue from the denominator adjustment) — both are directionally consistent (short, sector-leading collection cycles).

Return Ratios (FY24A-FY31E)

Working Capital Efficiency

KEY TAKEAWAYS

- Net Debt/EBITDA of 13.82x (FY26) is extreme in isolation, but is a young-asset-base artifact — EBITDA has not yet caught up to capacity built. The forward trajectory (Section 13) is the more decision-relevant number.
- Working capital discipline (receivables, payables both in the 50-70 day band) is a genuine, consistent operating strength across all three historical years.

One-Page Summary — FY26A Actual & FY27E-FY31E Forecast (Base Case)

Rs million	FY26A	FY27E	FY28E	FY29E	FY30E	FY31E
Income Statement						
Revenue	7,189	31,652	67,994	74,423	74,423	74,423
EBITDA	6,922	28,927	63,392	69,538	69,230	68,937
PAT	405	6,587	9,168	11,524	13,596	15,539
Balance Sheet						
Total Debt	129,205	373,764	367,599	343,093	320,220	298,872
Total Equity	34,239	58,826	67,994	79,518	93,114	108,653
Cash & Bank	33,575	28,542	26,668	34,859	46,179	60,046
Cash Flow						
CFO	4,700	14,474	25,239	32,697	34,193	35,215
Capex	85,155	259,510	20,948	0	0	0
Key Ratios						
EBITDA Margin	86.0%	88.9%	91.9%	92.2%	91.7%	91.3%
Net Debt/Equity	2.79x	5.87x	5.01x	3.88x	2.94x	2.20x
Interest Coverage	1.14x	1.75x	1.37x	1.47x	1.60x	1.73x
Capacity & Portfolio						
Operational Capacity (AC MW, cumulative)	1,324	Ramping to 7,910 MW total portfolio through FY29 (Base Case) — see Section 6				

Valuation summary at IPO price (Rs225): FCFE-DCF value per share Rs246.05 (+9.4% vs. IPO price); Forward EV/EBITDA (FY27E) 7.7x; Forward P/E (FY27E) 19.4x. See the accompanying Excel model (Valuation tab) for full multi-scenario detail.

KEY TAKEAWAYS

- Leverage is projected to peak (Net Debt/Equity ~5.9x, FY28E, per this report's model) before de-levering as the pipeline fully commissions and cash generation scales — the single number worth tracking quarter to quarter.
- All forecast figures are Base Case; Bear/Bull scenario sensitivity is built into the accompanying Excel model's Executive Summary tab.

Why Each Strength Matters to the Equity Story

1. In-house EPC & O&M — a genuine, quantified execution edge

147 days average early commissioning isn't a marketing statistic — it directly compounds equity returns by pulling forward each project's revenue-generating life within its 25-year PPA window, and it's the structural reason Juniper's EBITDA margin runs comparable to or above much larger peers despite a fraction of their scale.

2. Technology mix skewed toward complexity, not commodity

82.5% of the total portfolio is WSH/FDRE. This matters because these categories have thinner competitive fields (a #2 national ranking by capacity won in WSH/FDRE tenders, 96.8% win-rate) and structurally higher tariffs — Juniper is not competing primarily in the most commoditized, margin-compressed segment of the market.

3. Contracted, long-duration cash flows

94.9% of total capacity sits behind 25-year fixed-tariff PPAs with investment-grade counterparties — this is what makes a DCF/FCFE valuation approach appropriate at all for this business, and what underwrites the debt financing the growth plan depends on.

4. Structurally low, locked-in effective tax rate

The 115BAA/115BAB concessional-regime election (25.168%/17.16%) is permanent, not a holiday with a cliff date — every future year of PAT benefits from this, and it removes a forecasting uncertainty that exists for many Indian corporates still on the standard 34.94% regime.

5. Improving off-taker diversification

Top-2 concentration falling from 97.0% to 86.1% (FY24-26), with the forward pipeline skewed further toward central PSU off-takers — the counterparty risk profile is getting structurally better, not worse, as the company scales.

6. Early positioning in BESS/storage

India's first merchant BESS project is a genuine first-mover credential in a segment CRISIL identifies as scaling fast (50+ GWh tendered as of March 2026) — optionality value that isn't yet fully reflected in trailing financials.

KEY TAKEAWAYS

- Juniper's strengths cluster around execution quality and technology positioning — durable, company-specific advantages — rather than around balance sheet strength or scale, which are genuine relative weaknesses (Section 15).

Categorized Risk Assessment

Category	Risk	Why It Matters	Probability	Impact	Mitigation
Execution	UCA bucket (3,240 MW) timing — LOA-only, no PPA signed	This report's own model shows most UCA capacity landing inside FY27 under base-case timing, a compressed and aggressive assumption	Medium-High	High — directly drives revenue, leverage timing	Track PPA signing dates quarterly against LOA cohort
Capital allocation / Refinancing	Net Debt/Equity projected to peak ~5.9x (FY28E, Base Case); Interest Coverage already 1.14x (FY26A)	Thin covenant headroom; 95%+ of fund-based borrowings reset/reprice within a year, so rate moves hit immediately	Medium	High	Monitor quarterly leverage vs. this report's projected de-leveraging path from FY29
Counterparty	Top-2 off-takers still 86.1% of FY26 revenue	Concentration is improving but a single-counterparty dispute remains a material single-year revenue event	Low-Medium	Medium-High	Track off-taker mix shift as UCC/UCA capacity commissions
Tariff	25-year fixed tariffs with no inflation escalator	Cost inflation (labor, security, insurance, O&M) cannot be passed through outside narrow Change-in-Law provisions — a structural margin-compression risk over the PPA life	Medium (structural, not event-driven)	Medium	None available by contract design; only Change-in-Law relief
Interest Rate	Variable-rate exposure on the vast majority of borrowings	Financing agreements provide for variable-rate interest; rate increases flow straight to the P&L with no pass-through to fixed PPA tariffs	Medium	Medium-High	None disclosed (no hedging program identified in RHP for interest rate risk specifically)
Construction	Weather/force majeure damage (e.g., FY24 module/robotic-cleaner damage at Juniper Green Field)	Demonstrated, not merely theoretical — has already happened once in the disclosed history	Medium (recurring, weather-driven)	Low-Medium per event	Insurance (subject to its own adequacy risk, separately flagged in RHP)
Technology	Limited operating history with true wind+solar hybrid dispatch (Stellar's combined-technology tranche commissioned only ~1 month before FY26 year-end)	This report's model deliberately could not derive an empirical Juniper-specific hybrid CUF from the data — CUF assumptions for new WSH/FDRE capacity are regulatory-floor-anchored, not track-record-anchored	Medium	Medium	Track realized CUF at Stellar and other newly-hybrid-commissioned projects each quarter
Policy	Reduction/modification of government renewable incentives; potential tariff-adoption delays by regulators	Disclosed as a formal risk factor; sector-wide exposure, not Juniper-specific	Low-Medium	Medium	Diversified off-taker/regulator base partially mitigates
Merchant Exposure	170 MW sold at uncontracted merchant prices; limited operating history in merchant power	No long-term revenue visibility for this sliver of the portfolio; company itself discloses "limited experience with merchant power plants" as a risk factor	Medium	Low (small % of portfolio)	Partial fixed-price Bhutan PPA on 50 MW of the Cosmic merchant capacity
Business — Import/Trade	Rs45,463.83mn of FY26 equipment purchases from China; restrictions on renewable equipment imports flagged as a specific risk factor	Concentrated supplier base (top 3 suppliers = 63.24% of FY26 purchases) compounds this exposure	Medium	Medium-High	None specific disclosed; diversification is limited given global module/turbine supply concentration
Capital allocation — Contingent Liabilities	Contingent liabilities were 64.56% of net worth as of March 31, 2026	A large contingent exposure relative to the equity base for a company this newly-listed	Low-Medium (contingent by nature)	High if crystallized	None specific; monitor litigation/guarantee disclosures each filing
Governance	Promoter share pledge to IREDA (1.46% of pre-issue capital); ongoing related-party transactions across 48+ SPVs	Standard for project-financed IPPs, but a real dilution/governance risk if pledge is enforced	Low	Medium	Track pledge status post-listing (due to be re-pledged within 60 days of listing per RHP)

KEY TAKEAWAYS

- The dominant risk cluster is financial (leverage, interest rate, refinancing) and execution-timing (UCA bucket) — not demand, policy, or technology obsolescence, which are comparatively contained.
- This report's own model surfaces the leverage-peak and UCA-timing risks quantitatively (Section 6, Section 13) rather than treating them as qualitative RHP boilerplate — these are the two variables most worth an investor's own sensitivity testing.

What to Track Every Quarter

#	Monitorable	Why It Matters
1	New capacity commissioned (MW) vs. this report's Base Case timeline	Direct test of the UCA-timing assumption identified as the model's key risk
2	COD achievement dates vs. disclosed/estimated SCODs	Tracks the 147-day early-commissioning track record's continuation
3	New auction/tender wins (MW, technology, tariff)	Tests whether growth continues beyond the currently disclosed 7,910 MW pipeline (this report's base case assumes none)
4	PPA signing rate on the UCA (LOA-only) bucket	Leading indicator for whether UCA timing risk is resolving favorably or adversely
5	Realized tariff by technology, especially newly-hybrid WSH/FDRE COD	Validates or challenges the tariff assumptions in Section 6
6	Realized CUF at newly-commissioned hybrid (WSH/FDRE) projects	The single most important operating data point this report could not benchmark from history (Stellar's ~1-month track record)
7	Net Debt/Equity and Interest Coverage each quarter	Tests the leverage-peak-then-de-lever thesis directly
8	Refinancing activity / new debt facility terms	95%+ of borrowings reprice within a year — rate terms flow through fast
9	Days receivable / days payable	Tests continuation of sector-leading working capital discipline
10	Actual vs. modeled capex phasing	Tests this report's capex-timing simplification directly (see accompanying Excel model notes)
11	BESS capacity additions and merchant BESS economics	Tests the first-mover BESS thesis and provides real data for a currently-thin track record
12	Off-taker concentration (top 2, top 5)	Tests continuation of the FY24-26 diversification trend
13	Top-10 supplier concentration and China-sourced equipment %	Tests supply-chain/trade-policy exposure
14	Dividend policy announcement (or continued absence)	First-time issuer with no dividend track record — a capital-allocation signal investors are watching for
15	Contingent liability resolution (litigation, guarantees)	64.56% of net worth as of FY26 — any crystallization is a direct equity-value event

KEY TAKEAWAYS

- Monitorables #1, #4, #6 and #7 are this report's highest-priority items — they most directly test the assumptions this report's own valuation model is most sensitive to.

This report was prepared using the Red Herring Prospectus of Juniper Green Energy Limited dated July 23, 2026, and an independently constructed 48-SPV financial model. Figures marked "Not Disclosed" indicate information not identified in the RHP; this report does not estimate figures the company itself has not published. This is a research analysis for institutional distribution and does not constitute investment advice or a recommendation to buy, sell or hold any security.
